Letter to the Editor

American College of Medical Genetics Statement on Folic Acid: Fortification and Supplementation

To the Editor:

Serious congenital abnormalities occur in 2–3% of live births. Neural tube defects, cleft lip and palate, and cardiac abnormalities are some of the most common. There is now substantial evidence that periconceptual folic acid will reduce the incidence of neural tube defects by more than 50% and may also decrease the incidence of other malformations.

Regulations recently enacted by the Food and Drug Administration (FDA) will require the fortification of enriched grain foods with folic acid, starting sometime in 1998. While this is a step forward, the actual amount added may be insufficient to protect future children.

The American College of Medical Genetics strongly supports the FDA's action. However, in addition, it recommends the following:

- 1. Foods should be fortified with folic acid at levels increased from the current FDA recommendations of 0.14 to 0.28 mcg/100 g of grain.
- 2. Women in their reproductive years should take an additional 0.4 mg of folic acid daily, either alone or

- in a multivitamin preparation. This is particularly important prior to conception.
- 3. Women with a previous history of neural tube defects are advised to take 4.0 mg of folic acid daily, starting at least 1 month and preferably 3 months prior to conception.
- Adults should be advised of the benefits of folic acid supplementation to reduce the risk of cardiovascular disease.
- 5. Because of a potential concern of masking timely detection of B12 deficiency, the total daily intake of folic acid should not exceed 1.0 mg unless prescribed by a physician.

This guideline is designed primarily as an educational resource for medical geneticists and other health care providers to help them provide quality medical genetic services. Adherence to this guideline does not necessarily assure a successful medical outcome. This guideline should not be considered inclusive of all proper procedures and tests or exclusive of other procedures and tests that are reasonably directed to obtaining the same results. In determining the propriety of any specific procedure or test, the geneticist should apply his or her own professional judgment to the specific clinical circumstances presented by the individual patient or specimen. It may be prudent, however, to document in the patient's record the rationale for any significant deviation from this guideline.

Revised and approved by the American College of Medical Genetics Executive Committee on February 28, 1997.
